by joseph weizenbaum since the dawn of the age of computers people have cursed the difficulty of programming over and over again we encounter the suggestion that we should be able to communicate to a computer in natural language what we want it to do unfortunately such advice rests upon a misconception of both the computer and its task the computer might not be stupid but it is stubborn that is the computer does what all the details of its pro gram command it to do i e what the programmer tells it to do and this can be quite different from what the programmer intended the misun derstanding with respect to tasks posed to the computer arises from the failure to recognize

that such tasks can scarcely be expressed in natural language if indeed at all for example can we practice music chemistry or mathematics without their respective special symbolic languages yet books about computers and programming languages can be written more or less reasonably even if they are not quite poetic or lyrical this book can serve as an example of this art and as a model for anyone at tempting to teach inherently difficult subject matters to others klagenfurt april 1995 preface striving to make learning to program easier this book addresses primarily students beginning a computer science major for our program examples we employ a new elegant programming language modula 3
