in less than 100 years the power and telecommunications industries have become highly technological and competent in servicing the growing electrical power and communication needs of a complex modern society this tremendous advancement has not been without problems of mutual compatibility however in the early days of power and telecommunication transmission fundamental incompatibilities existed between the two systems since both used the earth as a ground return conductor as the length of both systems lines grew and the number of subscribers increased the inductive interference problems became more severe further expansion of both industries was seriously threatened when it became necessary to refer these problems to the courts and commissions for resolution such as california s general order 52 issued in 1912 as a consequence representatives from both industries joined in cooperative efforts to study and resolve the main causes of incompatibility this joint effort primarily between the edison electric institute and the bell system resulted in over fifty engineering reports during the 1920 s and 30 s this cooperation resulted in numerous advances and innovations with the primary development being paired conductors enclosed in metallic shielded cables for telecommunications transmission developments such as drainage reactors longitudinal chokes neutralizing transformers and isolation transformers also occurred and were applied to open wire lines to suppress power line interference the above practices and procedures were usually adequate in solving most electromagnetic and electrostatic induced voltage and current problems however in the 1960 s and 70 s certain design features and trends in the environment occurred that presented new and challenging problems in the area of incompatibility as a result the institute of electrical and electronic engineers ieee formed the inductive coordination and electrical protection icpep committee to provide effective execution of the following considerations 1 design of systems to minimize inductive interference and susceptibility 2 adopt standards and guidelines relating to interference 3 establish a continuing dialog between interested parties to provide a medium for exchanging information in the advanced planning stages of new facilities in the meantime some manufacturers have responded to the industry s

highly recommended for iit jee and olympiads 1000 problems with solutions and 100 articles this book collects together the problems set out at end of each chapter in the author s textbook of plane trigonometry along with the possible solutions which are linked with an explanation of the sort of reasoning used in order to arrive at one of the answers in many cases several answers are given for one question the result is a book which can be used independently of the main volume this book helps in acquiring a better understanding of the basic principles of plane trigonometry and in revising a large amount of the subject matter quickly it is also to be noticed that each example or problem is here enunciated at the head of its solution as well as all the relevant articles are part of the appendix so that the book though a fitting companion to the textbook is not inseparable from it but may be used as a book of exercises with any other treatise on plane trigonometry we are grateful for this opportunity to put the materials into a consistent format and to correct errors in the original publication that have come to our attention we are highly indebted to chandra shekhar kumar for the fruitful discussions which led to

the idea of masterminding this entire project he helped us put hundreds of pages of typographically difficult material into a consistent digital format the process of compiling this book has given us an incentive to improve the layout to double check almost all of the mathematical rendering to correct all known errors to improve the original illustrations by redrawing them with till tantau s marvelous tikz thus the book now appears in a form that we hope will remain useful for at least another generation

solving complex problems and selling their solutions is critical for personal and organizational success for most of us however it doesn't come naturally and we haven't been taught how to do it well research shows a host of pitfalls trips us up when we try we're quick to believe we understand a situation and jump to a flawed solution we seek to confirm our hypotheses and ignore conflicting evidence we view challenges incompletely through the frameworks we know instead of with a fresh pair of eyes and when we communicate our recommendations we forget our reasoning isn't obvious to our audience how can we do it better in cracked it seasoned strategy professors and consultants bernard garrette corey phelps and olivier sibony present a rigorous and practical four step approach to overcome these pitfalls building on tried and tested but rarely revealed methods of top strategy consultants research in cognitive psychology and the latest advances in design thinking they provide a step by step process and toolkit that will help readers tackle any challenging business problem using compelling stories and detailed case examples the authors guide readers through each step in the process from how to state structure and then solve problems to how to sell the solutions written in an engaging style by a trio of experts with decades of experience researching teaching and consulting on complex business problems this book will be an indispensable manual for anyone interested in creating value by helping their organizations crack the problems that matter most
