medical knowledge is not only necessary for people working and researching within the field of medicine humankind emerged due to the evolution of organic matter over the course of billions of years from our ancestors we have inherited the principles of organizing the genome an anatomical structure a chain of metabolic processes and a way to regulate physiological functions since these principles chains and methods are largely universal one can learn a lot about the biology of other non human living beings that inhabit our planet when studying human medicine at the same time any living being is born lives and dies in continuous interaction with a changing external environment the unfavorable influence of this environment can lead to the development of a variety of diseases this occurs so often that disease must be considered as an optional but practically unavoidable variant for not only human existence but also for all other species of animals plants fungi myxomycetes or microorganisms it follows that a biologist needs a certain amount of medical knowledge however in standard education programs students of biological specialities are devoted to studying the laws of life processes in detail mostly within the limits of conventional norms for a biologist everything that is outside these boundaries can seem to be a kind of chaos that goes beyond the laws of life and rational explanation

getting the right diagnosis is a key aspect of health care it provides an explanation of a patient s health problem and informs subsequent health care decisions the diagnostic process is a complex collaborative activity that involves clinical reasoning and information gathering to determine a patient s health problem according to improving diagnosis in health care diagnostic errors inaccurate or delayed diagnoses persist throughout all settings of care and continue to harm an unacceptable number of patients it is likely that most people will experience at least one diagnostic error in their lifetime sometimes with devastating consequences diagnostic errors may cause harm to patients by preventing or delaying appropriate treatment providing unnecessary or harmful treatment or resulting in psychological or financial repercussions the committee concluded that improving the diagnostic process is not only possible but also represents a moral professional and public health imperative improving diagnosis in health care a continuation of the landmark institute of medicine reports to err is human 2000 and crossing the quality chasm 2001 finds that diagnosis and in particular the occurrence of diagnostic errorsâ has been largely unappreciated in efforts to improve the quality and safety of health care without a dedicated focus on improving diagnosis diagnostic errors will likely worsen as the delivery of health care and the diagnostic process continue to increase in complexity just as the diagnostic process is a collaborative activity improving diagnosis will require collaboration and a widespread commitment to change among health care professionals health care

organizations patients and their families researchers and policy makers the recommendations of improving diagnosis in health care contribute to the growing momentum for change in this crucial area of health care quality and safety
