in 1956 two bell labs scientists discovered the scientific formula for
getting rich one was mathematician claude shannon neurotic father of
our digital age whose genius is ranked with einstein s the other was
john l kelly jr a texas born gun toting physicist together they applied
the science of information theory the basis of computers and the
internet to the problem of making as much money as possible as fast as
possible shannon and mit mathematician edward o thorp took the
kelly formula to las vegas it worked they realized that there was
even more money to be made in the stock market thorp used the
kelly system with his phenomenally successful hedge fund princeton
newport partners shannon became a successful investor too topping
even warren buffett s rate of return fortune s formula traces how the
kelly formula sparked controversy even as it made fortunes at
racetracks casinos and trading desks it reveals the dark side of this
winning scheme which is founded on exploiting an insider s edge

this volume presents a collection of contributions dedicated to applied problems in the financial and energy sectors that have been formulated and solved in a stochastic optimization framework the invited authors represent a group of scientists and practitioners who cooperated in recent years to facilitate the growing penetration of stochastic programming techniques in real world applications inducing a significant advance over a large spectrum of complex decision problems after the recent widespread liberalization of the energy sector in europe and the unprecedented growth of energy prices in international commodity markets we have witnessed a significant convergence of strategic decision problems in the energy and financial sectors this has often resulted in common open issues and has induced a remarkable effort by the industrial and scientific communities to facilitate the adoption of advanced analytical and decision tools the main concerns of the financial community over the last decade have suddenly penetrated the energy sector inducing a remarkable scientific and practical effort to address previously unforeseeable management problems stochastic optimization methods in finance and energy new financial products and energy markets should include in a unified framework for the first time an extensive set of problems related to real world applied problems in finance and practice world

this monograph presents a comprehensive study of portfolio optimization an important area of quantitative finance considering that the information available in financial markets is incomplete and that the markets are affected by vagueness and ambiguity the monograph deals with fuzzy portfolio optimization models at first the book makes the reader familiar with basic concepts including the classical mean variance portfolio analysis then it introduces advanced optimization techniques and applies them for the development of various multi criteria portfolio optimization models in an uncertain environment the models are developed considering both the financial and non financial criteria of investment decision making and the inputs from the investment experts the utility of these models in practice is then demonstrated using numerical illustrations based on real world data which were collected from one of the premier stock exchanges in india the book addresses both academics and professionals pursuing advanced research and or engaged in practical issues in the rapidly evolving field of portfolio optimization

the defensive value investor is a complete step by step guide to
building a high yield low risk share portfolio defensive investing
focuses on strong steady companies that produce decent rates of
income and capital growth but with risk often coming from a lofty
share price value investing on the other hand is focused on buying
companies on the cheap but cheap companies often deserve to be
cheap because they are high risk and unlikely to grow defensive
value combines the two and involves buying relatively defensive
