the theory of stellar atmospheres is one of the most important branches of modern astrophysics it is first of all a major tool for understanding all aspects of stars as the physical properties of their outer layers can now be found with high precision firm conclusions can be drawn about the internal structure and evolution of stars moreover improvements in our knowledge of the chemical composition of stars is shedding new light on the chemical evolution of galaxies and of the universe as a whole because the outer layers of stars are among the best understood astrophysical objects the theory of stellar atmospheres plays an important role in the study of many other types of objects these include planetary nebulae h ii regions interstellar matter and objects of interest in high energy astrophysics such as accretion disks close binaries dwarf novae cataclysmic variables quasars active galactic nuclei pulsar magnetospheres and seyfert galaxies finally as stars provide a laboratory in which plasmas can be studied under more extreme conditions than on earth the study of stellar atmospheres has strong connections with modern physics astronomical observations provided a vital stimulus in the early stages of quantum theory and atomic physics even today topics such as low temperature dielectronic recombination develop hand in hand with the interpretation of stellar and nebular spectra early work on mhd was similiarly motivated many such connections remain to be explored

excerpt from history of the gift kern and royer families while we are enjoying the results of the labor of our ancestors their memory is fast fading away and sinking into the darkness of oblivion time is indeed swiftly blotting from the records those whose memory we desire to perpetuate and their history would be lost forever if not soon gathered from the fast disappearing pages of memory and as time passes family ties grow more and more uncertain and finally drift apart often these connections become hazy and obscure making the historian s task difficult yea almost impossible it has indeed been a difficult task to gather the material from public records private records and authentic tradition and to arrange it in proper order it has been my lifelong design to do this so that the history of our ancestors and their descendants may be properly preserved and transmitted to posterity i have labored many months trying to make this little volume as nearly

correct as possible and the records in the following pages are probably more nearly so than they could be made by future generations it is a matter of painful regret that no more data and records were made and preserved by our early ancestors if this had been done the writer would have had an easier task nevertheless the preparation of this little volume has been a tedious but a pleasant work the new acquaintances which have been formed are in themselves very valuable and esteemed in order to gather the proper facts and material it was necessary for the author to do some traveling to different parts of the country this proved however to be an expensive luxury yet we do not in the least regret it about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

the purpose of this book is to give a self contained up to date account of the structure of unit groups of classical rings in so doing the work draws together four areas of mathematics ring theory group theory group representation theory and algebraic number theory the ensuing interplay between these disciplines provides a unique source of enrichment for each of them the main theme centers on two related problems to determine the isomorphism class of the unit group $U(R)$ of ring R in terms of natural invariants associated with R and to find an effective method for the construction of units of ring R various threads of the development are tied together to convey a comprehensive picture of the current state of the subject examples are provided to help research workers who need to compute explicitly unit groups of certain rings a familiarity with basic ring theoretic and group theoretic concepts is assumed but a chapter on algebraic preliminaries is included the text is distinguished by its very clear exposition

this groundbreaking biography of marshal tito of yugoslavia presents many startling new revelations among them his role as an international revolutionary leader and his relationship with winston churchill it highlights his early years as a comintern operative the context for his later politics as a leader of the non aligned movement nam the authors argue that in the 1940s between the dissolution of the comintern and the rise of nam tito's influence and ambition were far

greater than has been understood extending to italy france greece and spain via the international communist networks established during the spanish civil war klinger and kuljiš disclose for the first time the connection between tito s expulsion from the cominform and the rome assassination attempt on the italian communist party leader palmiro togliaatti the man who had plotted to overthrow tito tito s secret empire offers a pivotal contribution to our understanding of tito as a figure of real rather than imagined global significance this dazzlingly original book will reward all those who are interested in the history of international communism the cold war and the non aligned movement or in tito the man one of the most significant leaders of the twentieth century
